Modeling the Process of Drying Stationary Objects inside a **Tumble Dryer Using COMSOL Multiphysics**

Tarek H.M. Zeineldin

Outline

Introduction - Drying processes

Modeling Approach

- Transport Phenomena
- Governing Equations
- Boundary Conditions

Results and Validation

Summary and Conclusion

HEINZ NIXDORF INSTITUT Universität Paderborn Regelungstechnik und Mechatronik Prof. Dr.-Ing. habil. Ansgar Trächtler

Introduction

Textile is stationary Air enters dry; warm and leaves moist; cool Modeled Domains:

- Air Domain
 - Air and Vapor
- Textile Domain -
- **Textile and Water** Continuous exchange of heat and moisture

HEINZ NIXDORF INSTITUT

Moisture Transport:

- Wet Zone: Free Water & Vapor
- Dry Zone: Bound Water & Vapor
- Textile Surface: Vapor -

Vapor front migrates to the symmetry axis

Energy Transport – Boundary Equation

$$k_{t} \cdot \nabla T = \underbrace{\alpha \cdot (T_{a} - T)}_{1} + \underbrace{\rho_{w} \cdot D_{w} \cdot \nabla X \cdot \Delta h_{v}}_{2}$$

- 1. Convective Energy
- 2. Energy lost due to phase change

Energy Transport – Subdomain Equation

$$o_t \cdot c_{p,t} \cdot \frac{\partial T}{\partial t} = \underbrace{\nabla(k_t \cdot \nabla T)}_{1} - \underbrace{\underbrace{m_{ev} \cdot \Delta h_v}_{2}}_{2}$$

- 1. Conductive Energy
- 2. Energy lost due to phase change

Textile Domain

 $\label{eq:kt} \begin{array}{l} \mathsf{k}_t \text{: Textile heat conductivity} \\ \mathsf{T}, \ \mathsf{T}_a \text{: Temperature of textile and air} \\ \alpha \text{: Coefficient of heat transfer} \\ \rho_w, \rho_t \text{: Density of water and textile} \\ \mathsf{D}_w \text{: Capillary conductivity} \\ \mathsf{X} \text{: Textile moisture content} \\ \Delta \mathsf{h}_v \text{: Enthalpy of evaporation} \\ \mathsf{c}_{\mathsf{p},\mathsf{t}} \text{: Textile specific heat capacity} \\ \mathsf{m}_{\mathsf{ev}} \text{: Evaporative mass flow rate} \end{array}$

habil. A. Trächtler, Heinz Nixdorf Institut, Universität

Dr.-Ing.

Transport phenomena – Textile (Mass)

Mass Transport – Subdomain Equation

$$\rho_{w} \cdot \frac{\partial X}{\partial t} = \underbrace{\rho_{w} \cdot \nabla (D_{w} \cdot \nabla X)}_{1} - \underbrace{m_{ev}}_{2}$$

- 1. Capillary conduction
- 2. Vapor conduction

Mass Transport – Boundary Equation

$$\underbrace{\frac{D_{v} \cdot M_{w}}{R \cdot T} \cdot \nabla p_{v,t}}_{1} + \rho_{w} \cdot D_{w} \cdot \nabla X = \underbrace{\frac{\beta \cdot M_{w}}{R} \cdot (\frac{p_{v,a}}{T_{a}} - \frac{p_{v,t}}{T})}_{2}$$

- 1. Vapor conduction
- 2. Vapor convection

 $\begin{array}{l} \mathsf{D}_v: \text{Vapor diffusion coefficient} \\ \mathsf{M}_w: \text{Water molecular weight} \\ \mathsf{R}: \text{Universal gas constant} \\ \mathsf{p}_v: \text{Vapor pressure} \\ \mathsf{\beta}: \text{Coefficient of mass transfer} \end{array}$

Transport phenomena – Air (Energy/Mass)

- E. Transport – Boundary Equation (1,2,3 & 4)

$$k_a \cdot \nabla T = \alpha \cdot (T - T_t) + \underbrace{\rho_a \cdot c_{p,a} \cdot v \cdot T}_{q_a \cdot c_{p,a}}$$

M. Transport – Boundary Equation (1,2,3 & 4)

$$\rho_{v} \cdot D_{v} \cdot \nabla X - \underbrace{\mathbf{u} \cdot X}_{R} = \frac{\beta \cdot M_{w}}{R} \cdot (\frac{p_{v,a}}{T} - \frac{p_{v,t}}{T_{t}}) - \frac{D_{v} \cdot M_{w}}{R \cdot T_{t}} \cdot \nabla p_{v,t}$$

- Energy Transport – Subdomain Equation

$$\rho_{a} \cdot c_{p,a} \frac{\partial T}{\partial t} = \nabla (k_{a} \cdot \nabla T) - \underbrace{\rho_{a} \cdot c_{p,a} \cdot u \cdot \nabla T}_{}$$

Mass Transport – Subdomain Equation

$$\frac{\partial \mathbf{X}}{\partial t} = \nabla (\mathbf{D}_{\mathbf{v}} \cdot \nabla \mathbf{X}) - \underbrace{\mathbf{u} \cdot \nabla \mathbf{X}}_{\mathbf{v}}$$

• Additional convective terms due to air

a: Air

- u, v: Air velocity in the x and y direction
- a: Coefficient of heat transfer

Transport phenomena – Air (Energy/Mass)

Boundary Equations (5)

$$T = T_0$$

$$X = X_0$$

- Boundary Equations (6)
- $k_a \cdot \nabla T = 0$
- $D_{v} \cdot \nabla X = 0$
 - Convective flux
- Boundary Equations (7 & 8) $k_a \cdot \nabla T - \rho_a \cdot c_{p,a} \cdot u \cdot T = 0$ $D_v \cdot \nabla X - u \cdot X = 0$
 - Insulation

HEINZ NIXDORF INSTITUT Universität Paderborn Regelungstechnik und Mechatronik Prof. Dr.-Ing. habil. Ansgar Trächtler

Transport phenomena – Air (Momentum)

- Boundary Equations (1,2,3,4,7 & 8)
 - u = 0
 - No slip
- Boundary Equation (5) $u = u_0$
 - Fully developed flow
- Boundary Equation (6) $p = p_0$
 - Outflow

Test bench

HEINZ NIXDORF INSTITUT Universität Paderborn Regelungstechnik und Mechatronik Prof. Dr.-Ing. habil. Ansgar Trächtler

Modeled phenomena:

- Energy transport Textile
- Mass transport Textile

Simulation conditions:

rsität

Institut,

Nixdorf

Heinz

Trächtler,

habil.

-Ing.

- 10x7mm thick layers of cotton textile
- 0.6 initial moisture content
- 2.9KW commercial condenser dryer as test bench
- 120 m³/hr volume flow rate
- Textile temperature measured for validation
- Temperature and vapor pressure measured at drum inlet as boundary conditions
- 1/3 Real-time

Measured textile temperature: 3 measurement series

Simulation results

5°c max. temperature error

- Misplacement of the thermocouple (human error)
- Thermocouple temperature averaging affect
- Nonuniform textile geometry/surface
- Sensitivity of relative humidity sensors to water drops
- Temperature along the boundaries was held constant (Air flow was not simulated)

Simulation results vs. measurements

Model extension

Modeled phenomena:

- **Energy transport Textile**
- Mass transport Textile
- Energy transport Air
- Mass transport Air
- Momentum transport Air

Simulation conditions:

- 4x1mm thick layers of cotton textile
- 0.6 initial moisture content lacksquare
- 120 m3/hr volume flow rate
- Temperature & vapor pressure given at drum inlet ۲

volume

Reduced dimensions due to limited computer power

HEINZ NIXDORF INSTITUT Universität Paderborn Regelungstechnik und Mechatronik Prof. Dr.-Ing. habil. Ansgar Trächtler

Model B

- Sharp curves due to large integration steps
- Strong tendency to enhancement by decreasing the integration step
- Agreement with the ideal drying curves

Model B

rsität

Nixdorf

Heinz

Trächtler,

habil. A.

Ing.

Momentum transport

- Reduced size of the drum in order to meet the required mesh resolution
- Assumed laminar flow at the inlet
- Increase in velocity at lower cross sectional areas

Prof. Dr.-Ing. habil. Ansgar Trächtler

HEINZ NIXDORF INSTITUT

Universität Paderborn Regelungstechnik und Mechatronik

Summary and Conclusion

- Two successful models of stationary drying processes were built with COMSOL Multiphysics
- Successful application of governing equations in COMSOL Multiphysics despite nonlinearity
- Successful coupling of the five main drying transport phenomena
- Simulation results agreement with measurements
- Agreement with ideal drying curves
- Promising tendency for result enhancement with decreasing integration steps
- Using smaller thermocouples for future model validation
- Future opportunity of modeling the original geometry on increasing computer power
